Several reinforced concrete (RC) structures fail via concrete crushing in compressed zones. This is the case, for instance, of over-reinforced concrete beams, like in the four point bending tested by Mansur et al. [1]. When fiber-reinforced, the post-peak behaviour of

The fundamental propositions on which the mechanics of reinforced concrete is based are as follows: 1. The internal forces, such as bending moments, shear forces, and normal and shear stresses, at any section of a member are in equilibrium with the effects of the external loads at that section. 2.
