Gravitational waves passing through an object distort that object's shape, stretching and squeezing it in the direction the wave is travelling.

Gravitational wave detectors can pick up these distortions by splitting laser light into two perpendicular beams that travel for several kilometres before being reflected back to a detector.

Wavelength = Speed of light / Frequency of the wave. Wavelength in meters = 300,000,000 / Frequency in hertz.

Similarly, if you know how far the wave moves in one cycle (the wavelength), you also know how fast it oscillates because the speed of light is fixed: Frequency in hertz = 300,000,000 / Wavelength in meters
