concept of biodiversity. Genetic diversity (or variation) is the raw material for adaptation in a species. A species' future potential for adaptation depends on the genetic diversity held in the genomes of the individuals in populations that make up the species. The same is true for higher taxonomic categories.

why this biodiversity is in peril today, and discover what you can do to protect the species and ecosystems that support human life on Earth. This content is provided by the California Academy of Sciences.

Biodiversity and conservation | Biology | Science | Khan ...

(b) explain how biodiversity may be considered at different levels; habitat, species and genetic. Habitat - The range of habitats in which different species live. Each habitat will be occupied by a range of organisms. Species - The differences between species.

Biodiversity • A* Biology

The simplest and most common measure of biodiversity is the number of species that live in a certain area. For example, one acre of farmland may be dominated by only one species of plant; one acre of rain forest may contain 400 species of plants.
