Earth-Sky Relationships and the Celestial Sphere. Earth-Sky Relationships and the Celestial Sphere. Almost everyone who has looked up at the night sky has imagined that the Earth is in the middle of a large sphere on which the stars and planets move across the night sky. This model, while not literally correct, is a useful way to describe what we see in the night sky, and a useful way of describing the Earth in relationship to other celestial objects.

In winter, the Sun is low in the sky and the Sun's rays strike the Earth indirectly at an oblique (shallow) angle. The seasons occur because the Earth's axis is tilted relative to the path of its orbit around the Sun and not because the distance between the Earth and the Sun vary as the Earth revolves around the Sun.

The north and south celestial poles are the two imaginary points in the sky where the Earth's axis of rotation, indefinitely extended, intersects the celestial sphere. The north and south celestial poles appear permanently directly overhead to observers at the Earth's North Pole and South Pole, respectively. As the Earth spins on its axis, the two celestial poles remain fixed in the sky, and all ...

| Earth-Sun Relations: Figure 1 below shows that the orbit of the Earth about the sun is not circular. The path is elongated or elliptical. This means that the distance from the Earth to the sun varies through the year. Two special events are depicted in the diagram. Aphelion (July 4) is when the Earth is as far away from the sun as it ever gets.
