Huygens theorized that light consisted of waves. In 1801, Thomas Young offered convincing evidence for the wave model of light when he demonstrated that light could produce an interference pattern. Because light wave interference produces bands of light and dark, the results are often referred to as fringe. patterns.

This sim can be used in conjunction with a lab activity, or in place of one (in a pinch). Its intent is to develop the basic relationship governing the geometry of a two-slit interference pattern, and then to work with that relationship. The activity uses the PhET sim, Wave Interference. The Fringe of Optics (PhET page).

The pattern repeats with decreasing intensity as the angle increases left or right of $\theta = 0$. "m" is the order number of each bright fringe. m equals zero when $\theta = 0$; m is symmetric about $\theta = 0$. You will make a mark through the center of each bright fringe in the central envelope.
