Mpi Openmp Hybrid Parallelism For

Historical usage of MPI/OpenMP • MPI-OpenMP hybrid programming is not new • It was used to parallelise some codes on the early IBM pseries p690 systems – These machines were shipped with a quite weak “colony” interconnect • There are a number of codes are in use today that benefitted from this work

MPI/OpenMP Hybrid Parallelism for Multi-core Processors

A new message passing interface/open multiprocessing (MPI/OpenMP) hybrid parallel algorithm of the Hartree–Fock calculation is developed and implemented into the quantum chemistry program package GAMESS. In the algorithm, internode distribution is performed by MPI and intranode parallelization by OpenMP.

The combination of MPI and OpenMP strategies gives hybrid parallelization. This paper describes a hybrid parallel scheme implemented for the ARPS EnSRF system. In addition, observation data are organized into batches to improve the load balance when assimilating data from a number of radars. This paper is organized as follows.

A Hybrid MPI-OpenMP Parallel Algorithm and Performance ...

Only one thread makes any calls into the MPI library. For OpenMP, this means that calls can be made inside a parallel region, but the OpenMP omp master directives/pragmas should be used to ensure that the master thread makes all the MPI calls. MPI_THREAD_SERIALIZED. All threads may make MPI library calls, but the developer placed controls so that only one thread is active in an MPI call at any given time.

BEST PRACTICE GUIDETO HYBRID MPI + OPENMP PROGRAMMING 6 The benefit of a hybrid MPI + OpenMP implementation is that only one copy of replicated data is required per process, and within a process, data can be shared by threads with no (or substantially less) replication.

Parallel computing of 3D Discrete Element Method (DEM) simulations can be achieved in different modes, and two of them are pure MPI and hybrid MPI-OpenMP. The hybrid MPI-OpenMP mode allows flexibly combined mapping schemes on contemporary multiprocessing supercomputers.

In summary, the hybrid MPI/OpenMP model is a common method for computing in HPC. Both Xeon host and Xeon Phi coprocessors can be used to run this hybrid computing model. The Intel MPI library and Intel compiler offer three programming models: offload, native only and symmetric.

The use of hybrid scheme combining the message passing programming models for inter-node parallelism and the shared memory programming models for node-level parallelism is widely spread. Existing extensive practices on hybrid Message Passing Interface (MPI) plus Open Multi-Processing (OpenMP) programming account for its popularity.

Message Passing Interface (MPI) is a standardized and portable message-passing standard designed by a group of researchers from academia and industry to function on a wide variety of parallel computing architectures.The standard defines the syntax and semantics of a core of library routines useful to a wide range of users writing portable message-passing programs in C, C++, and Fortran.

Now I am ignoring MPI parallelism here because I think MPI can be combined with either OpenMP or CUDA (i.e. hybrid parallelism). Where as Cuda is in more direct competition with OpenMP. I also performed serial execution on the CPU as a reference (some problems are too small for parallelism).

Whether OpenMP or MPI is faster, the results are not directly comparable because MPI applies best to coarser-grained parallelism, which has less overhead, whereas OpenMP applies best to fine-grained parallelism.
