Schlumberger Dipmeter Interpretation - pele10.com

Schlumberger introduced a dipmeter for use in oil-based (nonconductive) mud systems in 1988. It uses micro induction resistivity measurements instead of the usual electrical resistivity pads. A knife blade electrode, or scratcher pad, version is available from several suppliers.

The dipmeter is a tool with arms arranged radially around a central mandrel with pads pressed against the borehole wall by a spring mechanism. Each pad measures the microresistivity of the formation. By correlating a microresistivity feature across the borehole, a plane can be defined and its dip and strike computed.

Schlumberger's DIPMETER ADVISOR system attempts to emulate human expert performance in dipmeter interpretation. It utilizes dipmeter patterns together with local geological knowledge and measurements from other logs. It is a typical example of the class of programs that deal with what has come to be known as signal to symbol transformation.

Once data is collected, measurement of geological planes and axes, on the field or from dipmeter/image logs (as it is said when interpreting images: picking is finalised) one of the first following steps in the workflow is the statistical analyses of the planar and axis populations.

Schlumberger has put into use a new method of dip computation based on the mathematical recognition of patterns. Hence the program is called "Pattern Recognition" (P.R.). Its commercial name is GEODIP. The results of computer processing of data recorded in a well are presented in various forms, mainly using a line printer or a plotter.

Dipmeter Advisor - Wikipedia

Successful stratigraphic interpretation depends on the analysis of several parameters. For many years, the dipmeter has been the key logging tool in stratigraphic interpretation. However, the nature of the measurement (four to eight microresistivity curves from four pads) placed some limits on a detailed interpretation beyond the wellbore.
