Ultrasound Guided Occipital Nerve Block

Introduction Greater occipital nerve (GON) block is often performed to ameliorate different types of chronic primary headache (headaches on > 15 days per month) including occipital neuralgia, cervicogenic, migraines and cluster headaches. This involves a local anesthetic injection with or without steroid.

USRA - Greater Occipital Nerve Block

Ultrasound-guided blockade of the third occipital nerve is useful in the diagnosis and treatment of cervicogenic headache, cervicalgia, and other pain syndromes subserved by the third occipital nerves. This technique is also useful as a prognostic indicator of the potential efficacy of destruction of the third occipital nerve with neurolytic agents such as phenol or radiofrequency lesioning.

When you see the ultrasound machine faithfully sitting in the corner, the answer comes to you: an ultrasound-guided occipital nerve block. A greater occipital nerve block can provide quick and prolonged pain relief for patients suffering from cervicogenic headaches, occipital neuralgia, and cluster headaches. There is some evidence to support the use of this block in NSAID overuse and tension-type headaches.

Ultrasound-guided bilateral greater occipital nerve block ...

The ultrasound-guided greater occipital nerve (GON) injection technique has been previously described. This technique has a higher success rate and might allow a more precise block of the nerve (25-27).

Ultrasound-Guided Greater Occipital Nerve Block: An ...

Ultrasound-guided occipital nerve blocks appear to be a relatively safe, effective, and easy procedure for both the diagnosis and treatment of occipital neuralgia. Compared to a blind landmark-based technique, ultrasound-guided nerve blocks allow for direct visualization of the greater occipital nerve, enabling providers to perform more targeted blocks and

potentially allowing for denervation procedures in the future.
